

AlKhair App

A management platform for Quran education, community operations, and finance.

Built from the current Laravel 12 + Livewire codebase in AlKhairPhp.
Focus: students, memorization, operations, and reporting.

Presentation overview deck

What the app mainly does

The current repository implements a single system for running the daily academic and administrative workflow of AlKhair.

Main functionality:

Run the end-to-end operations of a Quran and mosque education center in one place.

- People and access
- Teaching groups and enrollments
- Daily learning and attendance tracking
- Family billing, activities, and finance

The repo shows this scope clearly:

- â€¢ students, parents, teachers, users, and permissions
- â€¢ courses, groups, schedules, and enrollments
- â€¢ memorization sessions, Quran tests, assessments, and points
- â€¢ invoices, payments, finance requests, cash boxes, and reports
- â€¢ website pages, ID cards, print templates, barcodes, and APIs

Not a generic CMS or only a website

Main modules in the app

These are the major functional areas that appear in routes, models, Livewire screens, and services.

People and access

Users, roles, permissions, parents, teachers, students, profile photos, and scoped dashboards.

Academic structure

Courses, running groups, schedules, academic years, grade levels, and student enrollments.

Quran tracking

Page-level memorization, quick entry, partial tests, final tests, awqaf tests, and progression rules.

Attendance and performance

Student attendance, teacher attendance, assessments, results, points ledger, and student notes.

Finance and activities

Invoices, receipts, payments, activity registrations, request workflows, cash boxes, transfers, and exchange.

Identity, website, and API

ID cards, print templates, barcodes, bilingual public website, API tokens, and integration endpoints.

The strongest center of gravity is the combination of student operations, Quran progress tracking, and finance.

How the main business flow works

The application is organized around the journey from student onboarding to daily tracking, evaluation, and billing.

01 Register

Create parent, teacher, and student records. Assign permissions and profile data.

02 Set up

Set up courses, groups, schedules, academic year context, and active enrollments.

03 Track

Capture attendance, memorization sessions, Quran tests, and supporting notes.

04 Assess

Record assessments, exam results, pass or fail status, and progression milestones.

05 Reward

Apply point policies, manual adjustments, and cached progress summaries.

06 Bill

Issue invoices, collect payments, manage requests, and review finance reports.

Presentation takeaway: the app is not a collection of unrelated CRUD screens. It models one operational lifecycle for a learning center.

What makes this app specific to AlKhair

The Quran workflow and learning rules are where the product becomes specialized.

- Memorization is stored page by page, not as a loose summary.
- Duplicate lifetime pages are detected and prevented unless explicitly overridden.
- Final and awqaf tests follow progression rules based on passed earlier stages.
- Student progress screens combine pages, tests, attendance, points, and notes.
- A daily teacher summary API already exists for Telegram or n8n automation.

Memorization

Page-level history

Progression

Rule-driven tests

Automation

Daily teacher digest

Finance, activities, and operational support

The repo contains a fuller finance layer than a basic billing module.

Family billing

Invoices, invoice items, payments, printable receipts, and invoice status tracking.

Activity finance

Registrations, fee collection, expense tracking, and expected versus collected revenue.

Request workflows

Pull requests, expense requests, revenue requests, review actions, posting, and settlement.

Cash control

Cash boxes, assigned currencies, transfers between boxes, and non-negative balance safeguards.

Multi-currency

Currency rates, base and local equivalents, and exchange transactions with audit trails.

Operational tools

Reports, exports, barcodes, print templates, and ID card generation for front-desk workflows.

Who uses the app

Dashboards and access are role-based, with scoped permissions in both web and API flows.

Admin / Manager

Full operational visibility.

Manages people, settings, reports, finance, and system-wide workflows.

Teacher

Works on assigned groups.

Records attendance, memorization, Quran tests, assessments, and internal notes.

Parent

Views family-facing data.

Follows student progress, enrollments, activities, invoices, and payments.

Student

Uses a personal dashboard.

Sees personal learning progress, points, attendance, and active enrollments.

The API also uses token-based authentication with permission checks, so integrations follow the same access model.

Suggested demo path and final message

Use this order if you want to walk stakeholders through the app live after the presentation.

Recommended demo flow:

1. Dashboard and role-based navigation
2. Students and parent records
3. Groups and enrollments
4. Memorization and Quran tests
5. Attendance and points
6. Invoices, payments, and finance reports
7. Website or API integration screens

Main takeaway: AlKhair App is the operational backbone for a Quran learning organization, combining education tracking, community workflows, and finance in one system.
